

1 I/O

Java:

```
1 System.out.println("Hello world");
2 System.out.println("Earth is #" + 1);
3 int num = sc.nextInt(); // Assuming that you've
    done the appropriate overhead
```

Python:

```
1 print("Hello World")
2 print("Earth is #{}".format(1)) # Similar to printf
3 num = int(input('Enter a number: ')) # There is no
    overhead
```

2 if, else, and elif

Java:

```
1 if(CONDITIONAL) {
2     Stuff...
3 }
4 else if(CONDITIONAL) {
5     Stuff...
6 }
7 else {
8     Stuff...
9 }
```

Python:

```
1 if CONDITIONAL:
2     Stuff...
3 elif CONDITIONAL:
4     Stuff...
5 else:
6     Stuff...
```

3 Loops

3.1 while

Java:

```
1 while(CONDITIONAL) {
2     Stuff on repeat...
3 }
```

Python:

```
1 while CONDITIONAL:
2     Stuff on repeat...
```

3.2 C-Style for

Java:

```
1 for(int i = 0; i < n; ++i) {
2     Stuff on repeat n times...
3 }
4
5 for(int i = 0; i < a.length; ++i) {
6     Use a[i]...
7 }
```

Python:

```
1 for i in range(n):
2     Stuff on repeat n times...
3
4 for i in range(len(a)):
5     Use a[i]...
```

3.3 Python Style

```
1 for ai in a:
2     Stuff using ai ≡ a[i]...
3
4 OR
5
6 for i, ai in enumerate(a):
7     Stuff using ai ≡ a[i]...
```

4 Booleans

Java:

```
1 true
2 false
```

Python:

```
1 True
2 False
```

Python:

Java:

```

1  if(x > 1) {...
2  if(x >= 1) {...
3  if(x == 1) {...
4  if(x != 1) {...
5  if(!b) {...
6  if(b1 && (b2 || !b3)) {...
7  if(1 < x && x < 10) {...
8  if(x == y && y == z) {...

```

```

1  if x > 1:...
2  if x >= 1:...
3  if x == 1:...
4  if x != 1:...
5  if not b:...
6  if b1 and (b2 or not b3):...
7  if 1 < x < 10:...
8  if x == y == z:...

```

5 Arithmetic

Java:

```

1  x = 5;
2  x = x + 1; // x == 6
3  x += 1; // x == 6
4  x++; // or ++x; x == 6
5  x /= 2; // x == 2
6  N/A // Java does not support
7  N/A // Java does not support
8  N/A // Java does not support
9  x %= 2; // x == 1

```

Python:

```

1  x = 5
2  x = x + 1 # x == 6
3  x += 1 # x == 6
4  N/A # Python does not support
5  x /= 2 # x == 2.5
6  x //= 2 # x == 2 (Integer division)
7  x = 5 ** 2 # 25 (5 * 5)
8  x **= 2 # x == 25 (x * x)
9  x %= 2 # x == 1

```

6 Methods / Functions

Java:

```

1  ACCESS_MODIFIER RETURN_TYPE
    FUNCTION_NAME(PARAMETERS) {...
2
3  public int add(int x, int y) {
4      return x + y;
5  }

```

Python:

```

1  def FUNCTION_NAME(PARAMETERS):...
2
3  def add(x, y):
4      return x + y

```

6.1 Overloading

Java:

```

1  public int add(int x) {
2      return add(x, 5);
3  }
4
5  public int add(int x, int y) {
6      return x + y;
7  }
8
9  ...
10
11 add(3); // returns 8
12 add(3, 4); // returns 7

```

Python:

```

1  def add(x, y=5):
2      return x + y
3
4  ...
5
6  add(3) # returns 8
7  add(3, 4) # returns 7

```

7 Classes

7.1 Class Declaration

Java:

Python:

```

1 ACCESS_MODIFIER class CLASS_NAME extends
    PARENT_CLASS implements INTERFACES {...
2
3 public class MyClass extends ParentClass
    implements TheirInterface {...
4
5 public class MyClass {... // Implicitly extends
    Object class

```

```

1 class CLASS_NAME(PARENT_CLASS1, PARENT_CLASS2,
    etc):...
2
3 class MyClass(ParentClass):
4
5 class MyClass(object): # Explicitly extends
    object class

```

7.2 Constructor and Methods

Java:

```

1 public MyClass(int xIn, double yIn, boolean zIn) {
2     // Assuming that MyClass extends a class that
        has a constructor with int x
3     // Assuming that MyClass declared instance
        variables:
4     //     double y;
5     //     boolean z;
6     super(xIn);
7
8     y = yIn; // ≡ this.y = yIn;
9     z = zIn; // ≡ this.z = zIn;
10 }
11
12 public get2y() {
13     return y * 2; // ≡ return this.y * 2;
14 }

```

Python:

```

1 def __init__(self, x_in, y_in, z_in):
2     # Assuming that MyClass extends a class that
        has a constructor with int x
3     super().__init__(x_in)
4
5     self.y = y_in # ≠ y = y_in;
6     self.z = z_in # ≠ z = z_in;
7
8 def get2y(self):
9     return self.y * 2 # ≠ return y * 2

```

7.3 Initialization and Method Calling

Java:

```

1 MyClass mc = new MyClass(2, 3.5, true);
2 System.out.println(mc.get2y());

```

Python:

```

1 mc = MyClass(2, 3.5, True)
2 print(mc.get2y()) # Note that while self is an
        parameter I don't actually have to pass it

```

8 Example Factorial Program

8.1 Java

```
1 public class Factorial {
2     public static void main(String[] args) {
3         FactorialCalculator factCalc = new FactorialCalculator();
4
5         for(int i = 1; i <= 10; ++i) {
6             int fact = factCalc.calc(i);
7
8             if(fact > 100) {
9                 System.out.println("Large Answer: " + fact);
10            }
11            else {
12                System.out.println("Small Answer: " + fact);
13            }
14        }
15    }
16 }
17
18 class FactorialCalculator {
19     public int calc(int n) {
20         int result = 1;
21         while(n > 0) {
22             result *= n;
23             n--;
24         }
25
26         return result;
27     }
28 }
```

8.2 Python

```
1 class FactorialCalculator(object):
2     def calc(self, n):
3         result = 1
4         while n > 0:
5             result *= n
6             n -= 1
7
8         return result
9
10 factCalc = FactorialCalculator()
11
12
13 for i in range(1, 11):
14     fact = factCalc.calc(i)
15
16     if fact > 100:
17         print("Large Answer: {}".format(fact))
18     else:
19         print("Small Answer: {}".format(fact))
```
